## 21.9 Law of total Probability

Timestamp 3.00

- 1. Above is an example of use case where we use Law of total probability
- 2. We have two manufacturing factories X and Y. As shown above if we have a package where we have 60% of bulbs from factory X and rest 40% from factory Y. Now we need to find the probability that the bulb works for 5000hours.

A single bulb can't be manufactured in both factory A and B. So, this is a mutually exclusive event

Timestamp 10.6

A: event that a bulb work to sorbhs

Bx: event that a made at 
$$x$$

By:

$$P(A) = P(A \cap Bx) + P(A \cap By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

$$= P(A \mid Bx) p(Bx) + P(A \mid By) p(By)$$

We can solve the problem as shown above using total probability.

Then, 
$$(A) = p(A \cap B_1) + p(A \cap B_2) + p(A \cap B_3) + \cdots$$

$$= p(A \mid B_1) p(B_1) + p(A \mid B_2) p(B_2) + \cdots$$

$$= p(A \mid B_1) p(B_1) + p(A \mid B_2) p(B_2) + \cdots$$

$$= p(A \mid B_1) p(B_1) + p(A \mid B_2) p(B_2) + \cdots$$

$$= p(A \mid B_1) p(B_1) + p(A \mid B_2) p(B_2) + \cdots$$

$$= p(A \mid B_1) p(B_1) + p(A \mid B_2) p(B_2) + \cdots$$

• If you have several events B1, B2, B3,B4......etc. such that all are mutually exclusive events and union of all the events is sample space S (mutually exhaustive events). Then probability of any event A can be written as shown above using law of total probability.
